AUTHOR: Royzin, N. M.

TITLE: Unstable current distribution and the problem of reliability in the transistorized equipment

25

SOURCE: IVUZ. Radiotekhnika, v. 8, no. 2, 1965, 131-150

TOPIC TAGS: transistor, transistor reliability

ABSTRACT: The problem of reliability of transistorized equipment, whose life is determined by the Poisson distribution law, largely depends on the stability of current distribution both within the transistor and in its circuit. If a current fluctuation occurs in one of several parallel-connected negative-resistance elements, a current redistribution will take place, with all other elements assuming positive resistance. A new equilibrium will take place; criteria of intrinsic and extrinsic stability of a negative-resistivity medium are given. A criterion of the intrinsic current instability (for a one-variable model) is derived from an examination of the isothermal current-voltage transistor characteristic. Further, a criterion of instability of current distribution in a hot transistor switch under transient conditions is formulated. Current cumulation (concentration in the

Card 1/2

L 63848-65

ACCESSION NR: AP5014878

O

center of emitter) is held as the fundamental cause of the intrinsic instability. Reactance of the elements with N-shaped and S-shaped characteristics is considered insofar as it affects the transistor current concentration. As examples of pulsed circuits liable to instability conditions, these are considered: incomplete parallel connection of switches, series connection of switches, transients on power-supply turn-on, transformer-core saturation, and low temperatures. TITLE: On the thermal conductivity of indium

SOURCE: Fizika metallov i metallovedeniye, v. 15, no. 5, 1963, 800

TOPIC TAGS: Indium, thermal conductivity

ABSTRACT: According to published data, the thermal conductivity of In is 0.0576 cal/deg x cm x sec. The striking numerical agreement between this figure and that for the specific heat of In led the authors to investigate the accuracy of the published figure. Measurements were made by the longitudinal heat-flow method in the 40--150C temperature range, using grade B In of 99.997% purity. The total error of determination was 7--8%; it resulted from inaccuracy in thermocouple placement and from the error in determining the thermal emf. The determined value of heat conductivity,  $K = 0.170$  plus or minus 0.015 cal/cm x sec x deg, is three times as great as the one cited. Orig. art. has: 1 figure.

TITLE: Ten Years of Transistor Electronics (Desyat' let poluprovodnikovoy elektroniki)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy - Radiotekhnika, 1958, Nr 6, pp 639-646 (USSR)

ABSTRACT: The article reviews the past ten years in the development of the transistor, and the ideas that have played and will play the greatest role in past and future developments. The contribution of Ya.I. Frenkel' in the concept of the hole and hole-type conductivity in crystals is mentioned, as is the work of A.F. Ioffe on the use of a contact between P-type and electron transistors as a rectifying element, since experimentally verified and further developed practically with success. Junction transistor theory - based on work of the American William Shockley [Ref 2] - is described together with the problems encountered in perfecting this type of

Card 1/4

Ten Years of Transistor Electronics

SOV/142-58-6-1/20

unit, so that it might eventually replace the vacuum tube. The problem of raising transistor power ratings has been solved to the point where working voltages up to 100 V, and dissipation ratings of about 100 W - allowing control of outputs of the order of a KW or more - are permissible, thanks to new techniques of construction. New transistor materials have extended the working temperature range of germanium units up to 100 deg C, and of silicon units to 150-200 deg C. The prospective use of inter-metallic bonds of In P, Ga As, Al Sb, and silicon carbide should permit raising the upper limits to 300-500 deg C. Problems connected with decreasing noise in transistors at low, medium, and high frequencies are briefly discussed, as is the question of stabilization of transistor parameters. Problems connected with use of transistors at high frequencies are discussed at some length. The authors state that new methods of manufacturing p-n-p and n-p-n units

Card 2/4

Ten Years of Transistor Electronics

SOV/142-58-6-1/20

riers, achieved with carrier drift in a strong field. Operation of a n-p-i-p diode unit with negative resistance is described and illustrated (Figures 5,6), which unit is believed to be serious competition for oscillators in the centimeter wavelengths, the klystrons, lighthouse and metal-ceramic tubes. Quantitative theory of the diode with negative resistance shows that it can deliver watts and tens of watts of uninterrupted power at the centimeter wavelengths. The work of Bardeen and Brattain Ref 17 is also mentioned. There are 7 diagrams and 6 English references.

TITLE: An Investigation of Some Phenomena in the Work of Transistors in Pulse Circuits

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiotekhnika, 1959, Vol 2, Nr 4, pp 462-476 (USSR)

ABSTRACT: The author investigated theoretically and experimentally phenomena of transistor failure in pulse circuits. He divides his investigations into two parts: a) An investigation into the causes of the spontaneous generation of a collector current pulse; and b) The failure of transistors to operate in trigger circuits. Each part has a theoretical and experimental section. The experiments are described in some detail. In the first part of his investigations, the author arrives at the following conclusions: 1) The spontaneous opening of a blocked transistor is connected with the geometrical shape of the base, especially with the presence of lateral regions, where a considerable amount of carriers

Card 1/6

06358  
SOV/142-2-4-11/26

An Investigation of Some Phenomena in the Work of Transistors in Pulse Circuits

will accumulate. A discharge of these electrons and holes from the base region may be achieved only within a time of the order of the volume life-time. 2) The magnitude of the charges accumulating in the lateral regions of the base depends on the medium with which the transistor is surrounded. It is influenced by the speed of surface recombination (Tables 1, 2, 4). The surface recombination speed rises after heating in a vacuum and decreases in a moist atmosphere. 3) With a further temperature increase, the carrier recombination is reduced and their accumulation increases. A temperature reduction will lead to a recombination increase and to a reduction of the accumulation. 4) The specific resistance of the basic germanium has an essential influence on the magnitude of additional pulses. Transistors with identical geometrical shape, having only minor differences in the volume life-time -(the diffusion length varies from 0.3 to 0.5 mm),

Card 2/6

06358  
SOV/142-2-4-11/26

An Investigation of Some Phenomena in the Work of Transistors in Pulse Circuits

show considerable differences in the magnitude of the additional pulse. The latter is connected with the fact that the surface recombination speed changes considerably with a reduction of the specific resistance of the base material (Table 3 and Appendix). - In the second part of his investigations, the author arrives at the following conclusions: 1) The pulse characteristics of a transistor are influenced by phenomena in the surface layer of the semiconductor at low starting frequencies. 2) The holes injected into the base of a transistor will occupy the surface with a time constant of approximately 0.5 seconds at a temperature of 20°. 3) The holes may diffuse the surface layer. The diffusion factor is of the order of  $10^{-6}$  cm/sec. 4) The positive charge of the surface states distorts the picture of the field in the barrier layer close to the surface, where the magnitude of the field may be considerably higher than in the central region. There, it

Card 3/6

06358  
SOV/142-2-4-11/26

An Investigation of Some Phenomena in the Work of Transistors in Pulse Circuits

is determined by the concentration of the space charge of impurity atoms. The higher value of the field close to the surface may lead to a multiplication phenomena. 5) The drift of the surface states, comprising the holes in a strong field of the barrier layer, will lead to a resorption of the positive surface charge in the neighborhood of the barrier layer, in connection with the extraction of holes to the collector region. Consequently, the field in the barrier layer, close to the surface, is gradually weakened, and the multiplication of carrier is attenuated. 6) Temperature dependences reflect the regularities of the process they cause: a) the multiplication is reduced with rising temperatures and is increased with a temperature reduction; b) decreasing temperatures delay the capture of holes, diffusion and drift, these processes are speeded up by rising temperatures. 7) In a vacuum of  $10^{-6}$  mm mercury column, those surface states will disappear which

Card 4/6

06358

SOV/142-2-4-11/26

An Investigation of Some Phenomena in the Work of Transistors in Pulse Circuits

will capture holes. With the introduction of moisture they will return; 8) The multiplication effect and related phenomena caused by the surface charge will influence especially transistors with a low specific resistance of the base. The author emphasizes that the volume effect of "self-opening" fades with a reduction of the specific resistance. 9) The regularities and the surface properties detected by the author will not only explain the failure to operate of transistorized trigger circuits, but they will be useful for explaining a number of other transistor phenomena; frequency dependence of puncturing voltages, hysteresis of voltampere characteristics, failures of circuits with common emitter or base, etc. The publication of this paper was recommended by the Department of Electronics of the Moscow inzhenerno-fizicheskiy institut (Moscow Physics Engineering Institute). There are 1 oscillogram, 4 circuit diagrams, 2 diagrams, 6 graphs, 6 tables and

The yearly scientific meeting was held from 17 April to 15 May 1959 in the Workeveld Institute (Hosea Gersetza-Pietermaritzburg Institute). More than 600 participants from 100 different institutions attended the 2 Plenary and 18 scientific conferences. A total of 143 lectures were held. Lectures were specially arranged by K. Romanovald on the thermodynamic foundations of molecular generators and whistlers; A. L. Lovett on the construction of a fast reactor; J. C. G. van der Linde and D. H. B. Smith on permeability and momentum of ions of the nucleus; A. C. F. Gurney on space electric electron gravity wave; V. L. Gurney on absorption curves which are excited in the nucleus shell; and sections on comprehending them, I. Rosenblatt and L. A. P. Probyn on the analysis of the possible experiments for the determination of the measurements of the possible dimensions, I. J. Danielson on the crystallization of liquid nitrogen under pressure (5000-10000 atm); and an apparatus for measuring the absorption curves, J. A. Gurney and Q. V. Gurney on a new application of the ionization chamber; I. V. Gurney on a new calculation method for linear electric accelerators with arbitrary waves; S. A. Bludov, A. S. Mikhalev and A. N. Shchegolev on new theories of electron capture under relativistic conditions; G. A. Tsyplukin on optimum wave lengths for a generator; S. P. Lommer and G. A. Tsyplukin on calculations of the acceleration electron accelerators; and others.

Chemistry on examination of the elevation movement in the system of the electron with consideration of the scattering fields. —  
Eggers on Laplace method for examining the heat conduction  
Properties of liquids and the theory of this method. —  
Kraatz on the electronic heat conduction. —  
Lilien and Zeldovich on heat transmission  
Problems on heat transmission in a circular space. —  
Problems on heat transmission in a rectangular space. —

Based on heat transmission to circulating spaces,  
Bogolyubov's spatial conditions were verified with a flat triode with the impulsive technique. O. I. Pecherskaya<sup>1</sup> on calculation methods of construction of an impulse transducer; for instruments with semi-conductor elements, Ya. A. Leonov<sup>2</sup> based on a possibility to judge the characteristics of magnetic recording of impulses.  
S. I. Tikhonin<sup>3</sup> on the element computer, S. M. Ljubimov<sup>4</sup> on principles for a universal digital system, V. V. Kostylev<sup>5</sup> on control of the parameters of processing systems, P. N. Kostylev<sup>6</sup> on analysis of several systems which, when physical research on saturation can be automatically started. N. I. Smirnov<sup>7</sup> based on a method to examine the quality of a reactor control, where the reactivity changes stepwise or linearly. G. A. Leonov<sup>8</sup> based on the method of the lodging method of performing calculations on calculation of the metal obtained by the method of plasma synthesis, and G. D. Ryabukha on examination of the heterostructure of carbon, tungsten, iron, and other elements. S. S. Zhdanov<sup>9</sup> and his alloy by use of proton radiography. G. D. Pecherskaya<sup>10</sup> on selection of the alloy of the subunit base of S. M. Ljubimov<sup>11</sup> and Yu. V. Tsvetkov<sup>12</sup> by using radioactive indicators and also on the method of determining the diffusion coefficients of elements of the magnetic nickel, iron and chrome nickel steel. In the literature for all these lectures will be published by the MIFI in a collection.

AUTHORS: Rozin, N.M. and Markovich, M.I.TITLE: Measurement of the thermal resistance of power  
transistorsPERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,  
Radiotekhnika, v.4, n.3, 1961, pp. 341 - 343TEXT: In determining the thermal resistance  $R_T$  of a  
transistor the formula:

$$R_T = \frac{\Theta_b - \Theta_c}{P} \quad (1)$$

is used, where  $\Theta_b$  is the base-region temperature,  
 $\Theta_c$  the transistor case temperature, and  
 $P$  the power dissipation.

Of these parameters,  $\Theta_c$  and  $P$  are easily measured. A  
method of determining  $\Theta_b$  by measuring the emitter-base

Card 1/4

X

E036/E335

Measurement of ....

voltage ( $V_{eb}$ ) at constant emitter current is given in this short note. The method is particularly applicable to diffused base transistors in which  $I_{co}$  is not available as a measure of base temperature. It is noted that in silicon transistors it is necessary to take account of the emitter junction dissipation in addition to the power dissipated in the collector. The measurement is carried out by first dissipating power in the transistor to heat the base region up to a temperature which is then found by measuring the temperature-sensitive parameters whilst the power is no longer being dissipated. Calculation and experiment indicate that the thermal relaxation time is several milliseconds and thus the base-temperature determination must be effected in an order less than this to avoid serious errors. The power dissipation is effected by applying a square pulse of 5 msec duration to the emitter. The interval between successive pulses was 0.5 milliseconds.

Card 2/4

X

29630  
S/142/61/004/003/012/016  
E036/E335

Measurement of ....

The voltage amplitude of the input pulse may be varied up to 4 V, the output resistance of the pulse-generator being  $5 \Omega$ . During the interval between pulses a current of 10 mA flows through the emitter and the base-emitter voltage is measured by a peak voltmeter. Circuit details are given. A correction is made for the finite voltage drop across the semiconductor diode detector in the voltmeter circuit which occurs during the pulse. In setting up the measuring apparatus an allowance is also made for the variation of the "built-in" potential with temperature, which is found by measurement. In an additional note the thermal relaxation time is calculated approximately for a silicon transistor. In solving the heat-diffusion equation, it is assumed that: heat passes from the base through the collector body only, which is assumed uniform and had the physical characteristics of silicon; the temperature of the transistor case is constant. The first terms of a series solution, obtained by operational methods, for the rise in temperature of the collector junction are quoted. Inserting typical values gives a time constant of 0.73 msec, which is X

Royzman, I.

AUTHOR: Royzman, I. Teacher of Economic Geography (Kishinev) 2-3-11/14

TITLE: Check More Carefully the Statistical Figures to Be Published.  
(Vnimatel'neye proveryat' publikuyemyye statisticheskiye tsifry)

PERIODICAL: Vestnik Statistiki, 1957, No 3, May-June, p 82 (USSR)

ABSTRACT: The author of this letter to the periodical points out errors in the review "Economic Development of European Countries of Peoples Democracies" ("Razvitiye ekonomiki yevropeyskikh-stran narodnoy demokratii") edited by Vneshtorgizdat. The following errors are mentioned. On p.7 it is indicated that production of electric power per capita in Poland in 1955 was 642 kw/hrs, and on p. 18 it is said to be 651 kw/hrs. The coal output in Czechoslovakia is given on p. 7 as 62,8 million tons, and on p. 60 as 63,9 million tons. The coal output in Rumania is 5.2 million tons on p. 7, and 6.2 million tons on p. 180. The coal output in Poland was, according to the same page 7, 94.4 million tons, but according to page 20 this was only the output without brown coal, and the entire coal output was over 100 million tons. The total output including brown coal in Hungary and Czechoslovakia is given on the same page 7, so that for Poland it was an exception which was not mentioned in the text. There are more errors. The author thinks that the

✓ The activity of blood catalase in neuro-retardation sleep.  
I. S. Rozzman (Med. Inst., Vinnitsa). *Ukrain. Biokhim. Zhur.* 28, 37-45 (Russian summary, 45-8) 1958. — The expts. were performed with rabbits. Neuro-retardation was brought about through the administration of ether (I),  $\text{CHCl}_3$  (II), chloral hydrate (III), urethan (IV), amyital (V), and pentothal (VI). The activity of catalase was detd. during 2-hrs. sleep and after waking. Neuro-retardation sleep occasions an hypoactivity of catalase (hypocatalasemia), the degree of which varies with the type of neuro-retardation, chem. nature of the narcotic agent, and with the duration of the sleep. In order of intensity of hypocatalasemia produced the drugs arranged themselves in the following order: II > I > III > IV > V > VI, indicating that the inhalation narcotics are more strongly neuro-inhibitive than are the barbiturates. The inhibitive effect on catalase activity in all types of drug sleep persists for a time after the animal's awakening, especially in drug sleep of long duration. The catalase index, likewise, is lowered, except in the case of III, where such index is slightly increased. After 24 hrs. of drug sleep the magnitude of the catalasemia index was in the following order: VI > IV > III, IV > I, II. The activity of catalase in the erythrocytes in drug sleep is inhibited, with the exception of VI. Such inhibition may be secondary to several physico-chem. and biochem. changes in the organism. It is believed that the general reduction in the catalase activity bears some basic relation to changes in the no. of erythrocytes.

Title : Effects of Microelements upon Fertility of Downy Rabbits and Sheep.

Orig Pub : V sb.: Mikroelementy v s.-kh. i meditsino. Riga, AN LatvSSR,  
1956, 589-592

Abstract : When adult rabbits were weekly given 0.7 to 1.0 mg of  $\text{CoCl}_2$  per capita, their down yield increased by 25-35 percent, and the down yield of their young increased by 32.7 percent. In test female rabbits, higher indicators with regard to fertility, general weight of litters, erythrocyte blood counts, and wool productivity were noted, as well as an increase of cobalt content in wool, milk, and blood. In experiments on sheep, weekly administrations of combined microelements of 20 mg of  $\text{CoSO}_4$  + 20 mg of  $\text{CuSO}_4$  + 35 mg of  $\text{FeSO}_4$  per capita resulted in positive effects upon the development of lambs.

Balancing flexible rotors of turbomachines. Trudy MAI no.136:  
144-162 '61. (MIRA 14:11)  
(Impellers) (Balancing of machinery)

S/535/61/000/136/006/006  
E191/E381

AUTHORS: Levit, M.Ye., Candidate of Technical Sciences and  
Kolosov, Yu.A., Royzman, V.P., Engineers

TITLE: The balancing of flexible rotors in turbo-machinery

SOURCE: Moscow. Aviatsionnyy institut. Trudy. no. 136. 1961.  
Nekotoryye voprosy issledovaniya kolebaniy v  
aviatsionnykh dvigatelyakh. 144 - 162

TEXT: In the practical operation of gas-turbine rotors, it  
is known that rotors which are dynamically balanced at low speed  
may have unacceptable vibrations at the operating speed whilst  
smoothly running rotors may be formally unbalanced. This  
apparent contradiction is due to the basic assumption of rigidity  
of the rotor underlying present-day dynamic balancing. Methods  
for the balancing of multi-disc rotors of full-scale gas-turbine  
engines at operating speed have been under development at the MAI.  
The method proposed in the present paper is based on the gradual  
reduction of the maximum deflection of the elastic line found  
experimentally. In contrast to existing methods, the rotor is  
mounted in its proper engine casing and rotated at its operating

Card 1/2

E191/E381

The balancing of ....

speed. Apparatus and equipment to accomplish this method are described, as well as the theoretical foundations which underlie the requirement for dynamic balancing of flexible rotors at operating speeds. Balancing can be performed either in a vacuum installation (Author's Certificate no. 117925) when driven by an electric motor or on a test bed during engine tests. The vacuum chamber, its drive system and the measuring apparatus are described in some detail as well as calibration methods. The most important conclusion is that, when balancing at the operating speed, it is insufficient to apply correction masses at the extreme ends of the shaft and essential to attach masses also in another section roughly in the centre portion of the rotor. ✓  
The recommended procedure is the separate static balancing of all components which enter into the rotor assembly, followed by conventional dynamic balancing at low speed, applying corrections at the extremities and finally balancing at full speed using an additional central correction plane. There are 11 figures and 2 Soviet-bloc references.

TITLE: Engineering and Geological Investigations for Hydro-  
technical Structures (Ob inzhenerno-geologicheskikh  
issledovaniyakh dlya gidrotehnicheskikh sooruzheniy)

PERIODICAL: Tr. 2-go nauch-tekhn. soveshchaniya po proyektir. i str-  
vu gidroelektrostantsiy, Moscow-Leningrad, 1956,  
pp 224-226

ABSTRACT: The value of engineering geological studies in con-  
structing hydrotechnical structures is underestimated.  
The author shows that there is a disagreement between  
the geological conditions in the excavation, dug for  
the hydraulic structure, and the geological sections  
given as the basis for the project. He proposes a  
number of measures to eliminate this disagreement:  
1) to send to the Water-Power Project Institute geo-  
logists from a number of institutions of higher learn-

Card 1/2

15-57-3-3765

Engineering and Geological Investigations (Cont.)

ing; 2) to establish an order of work in the field of engineering geology, during which the observations and descriptions of the excavation should become an important stage in the geological investigations conducted by the same geologists who made the exploratory survey; and 3) to bore large diameter drill holes (three to five units) during investigation of the construction areas and to study them in detail for the conditions of formation of the soil in the areas which are to be the sites of the hydroelectric stations, and also in the ditches. To avoid horizontal segregation in earthen structures it is suggested that uncontrolled deposition be replaced by controlled deposition.

Field testing of rock foundations of high-pressure gravity dams.  
Gidr.stroi. 30 no.2:21-25 F '60. (MIRA 13:5)  
(Dams)

ROZA, Sergey Adol'fovich; SAMSONOVA, M.T., red. izd-va; YEZNOVA, L.L.,  
tekhn. red.

[Soil mechanics]Mekhanika gruntov. Moskva, Gos.izd-vo  
"Vysshiaia shkola," 1962. 228 p. (MIRA 15:11)  
(Soil mechanics)

ROZA, Sergey Adol'fovich; TSYTOVICH, N.A., prof., retsenzent; ENDER,  
G.V., kand.tekhn.nauk, red.; SOBOLEVA, Ye.M., tekhn.red.

[Calculating the settlement of structures of hydroelectric  
power stations] Raschet osadki sooruzhenii gidroelektro-  
stantsii. Moskva, Gos.energ.izd-vo, 1959. 330 p. (MIRA 12:8)

1. Chlen-korrespondent AN SSSR (for TSytovich).  
(Foundations) (Soil mechanics)  
(Hydroelectric power stations)

ROZA, S. A.

ROZA, S. A. Resistance to shear stress by rock layers in foundation of  
hydraulic engineering structures. Moskva, Gos. izd-vo lit-ry po stroitel'stvu  
i arkhitekture, 1952. 5 (i. e. 53) p.  
(53-15262)

TA775.R67

ROZA, S.A., kandidat tekhnicheskikh nauk.

Data on the experimental study of the initial percolation gradient  
in compact clays. Sbor. trud. VNIIGS no.4:28-50 '54. (MIRA 9:2)  
(Soil percolation)

ROZA, S. A.

Soprotivleniye skal'nykh Pored Osnovaniya Gidrotekhnicheskogo Sooruzheniya  
Sdvigayushchemu Usiliyu (Resistance to shear stress by rock layers in foundation  
of hydraulic engineering structures)  
Moskva, Gosstroyisdat, 1952  
53 p. tables,  
"Literatura": p. (55)

SO: N/5  
661.4  
.R8

"APPROVED FOR RELEASE: 07/19/2001

CIA-RDP86-00513R001445520016-3

ROZA, S.A., doktor tekhnicheskikh nauk.

Rising of the bottom of the foundation pit of concrete hydrotechnical structures. Gidr.stroi 23 no.6:9-12 '54. (MLRA 7:9)  
(Soil mechanics) (Hydraulic engineering)

APPROVED FOR RELEASE: 07/19/2001

CIA-RDP86-00513R001445520016-3"

ROZA, S.A., doktor tekhnicheskikh nauk.

Properties of silt composing the foundation of an earth dam. Gidr.  
stroi. 23 no.3:34-38 '54. (MIRA 7:6)  
(Dams)
